

Identification of Aggressive Prostate Cancers: In-depth Proteomics of Tissues and Urines

Thomas Kislinger
Princess Margaret Cancer Centre
University of Toronto, Department of Medical Biophysics

11th EDRN Scientific Workshop
September 9-12, 2019
Bethesda, USA

Introduction

1. Current diagnostic and prognostic protocols (PSA, DRE, biopsy) are inaccurate in predicting patients' risk
2. Molecular biomarkers and/or imaging approaches could improve the decision process
3. Molecular profiling of prostate cancer tissues and proximal fluids (post-DRE urine & dEPS) at the level of DNA, RNA and protein
4. Biomarkers for early detection of aggressive disease

Prostate Proximal Fluids

Direct EPS	post-DRE-urine
Proteins & cells shed by the gland	Prostatic secretions in urine (DRE)
Rich source of prostate biomarkers	Can be collected frequently - longitudinal
Collected prior to RP	Applicable to routine collection

Tested

C8 beads

MStern

Berger et al. MCP 2015

MStern Protocol

- 10 – 20 µg of protein
- short enzymatic digestion (4 h)
- Multiplexed sample preparation

Vacuum Manifold

- Binding to PVDF membrane
- 200 uL input

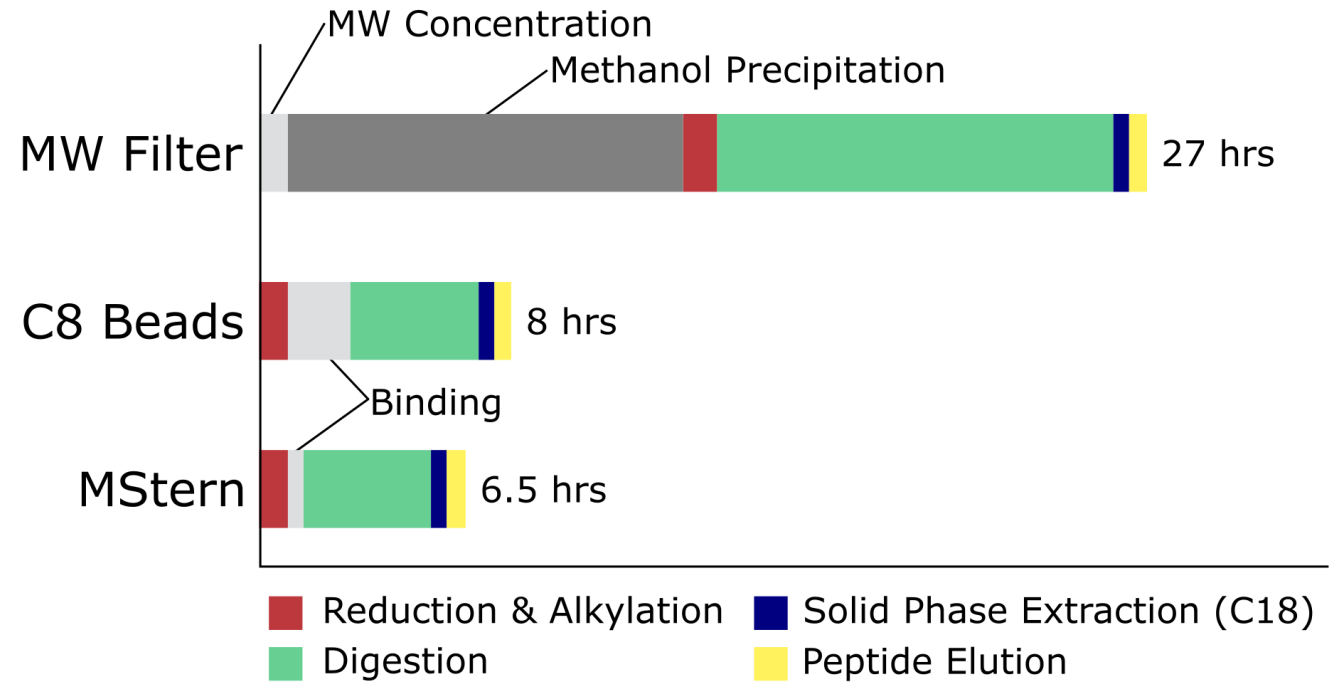

Solid Phase Extraction

- in-house made stage tips
- Large-scale format

MStern Protocol

- 10 – 20 µg of protein
- short enzymatic digestion (4 h)
- Multiplexed sample preparation

Technology Advances

	Drake et al. 2010	Kim et al. 2012	Fritsch 2019 (unpublished)
Input material	100 ug	100 ug	15 ug
Sample processing (hrs)	27	27	6.5
Gradient length	9x120 min (18 hrs)	9x120 min (18 hrs)	135 min
Proteins detected	916	624	2852
Proteins/sample	366 +/- 127	166 +/- 47	1915 +/- 292

● Drake et al./Kim et al. (n = 41) ● Fritsch et al. (n = 148)

Differentially Expressed Peptides

Final Peptides (865 down, 406 up)

Prostate Cancer Database

Summary

Proteomics of prostate cancer

- A. Markers of aggressive disease
- B. Integration of tissues and fluids
- C. Combination of complementary biomolecules
- D. Relational database
